Then
$$N(p) a(p) | n(p) \rangle = ([N(p), a(p)] + a(p) N(p)) | n(p) \rangle$$

$$= (-a(p) + a(p) N(p)) | n(p) \rangle = -a(p) | n(p) \rangle + a(p) | n(p) | n(p) \rangle$$

$$= (n(p)-1) a(p) | n(p) \rangle$$

$$= (n(p)-1) a(p) | n(p) \rangle$$
So $a(p) | n(p) \rangle$ is an eigenstate of $N(p)$ with eigenvalue $n(p)-1$

Also N(p) a+(p) |n(p) > = (n(p)+1) a+(p) |n(p) >

So at (p) In(p) > is an eigenstate of N(p) with eigenvalue n(p)+1

We identify N(p) as a particle-number operator while a(p) and a(p) are annihibation and creation operators.

Hamiltonian H=
$$\int \frac{J^3 \rho}{(2\pi)^3} \frac{\rho^{\circ}}{2} \left[a^{\dagger}(\rho) a(\rho) + a(\rho) a^{\dagger}(\rho) \right] = \int \frac{J^3 \rho}{(2\pi)^3} \rho^{\circ} \left(N(\rho) + \frac{1}{2} \right)$$

ground state (vacuum) 10> and a(p)10>=0

So N(p) 107=at(p) a(p) 10>=0 > vacuum contains no particles
Also at(p) 10> are one-particle states with momentum p

We can ignore the zero-point energy and redefine

H=
$$\int \frac{d^3 \rho}{(2\pi)^3} \rho^{\circ} N(\rho) = \int \frac{d^3 \rho}{(2\pi)^3} \rho^{\circ} a^{\dagger}(\rho) a(\rho)$$

<0/4/107 = (d'p p° <0 | at(p) a(p) | 07 = 0 since a(p) 107 = 0 Normal ordering: put all annihilation operators to the right of all creation operators. Denote it by :: So:aa:=ata 14 \(\psi^{+}(\times) = \int_{\frac{13p}{(2\tau)^3}(2\rho^0)^{1/2}} \alpha(\rho) e^{-ip\cdot x} \\
